

Dataset catalogue

Overview

MORIE ships a portable SQLite layer with dozens of built-in datasets covering Canadian carceral, police, oversight, and public- health surveillance corpora. This vignette shows how to discover and load them from R.

Browsing the catalogue

```
library(morie)
catalog <- morie_dataset_catalog()
head(catalog)
```

Each row of the returned data frame describes one dataset: identifier (e.g. `otis-2025`, `cpads-2122`), source, year, number of rows, and a short description.

Per-dataset detail

```
morie_dataset_info("cpads-2122")
```

`morie_dataset_info()` returns a list with the variable names, labels, value codes, citation, and any data-acknowledgment disclaimer required by the original publisher.

Loading data

```
df <- morie_load_dataset("cpads-2122")
dim(df)
```

`morie_load_dataset()` returns a tibble. Public-use datasets shipped inside the package require no further configuration.

Configuring local + remote backends

For datasets backed by external SQLite mirrors:

- Set `MORIE_LOCAL_DB_DIR` to a directory of `.sqlite` files for fast offline access.
- Set `MORIE_REMOTE_URL` to an HTTP SQL-over-REST endpoint for network-only exploration.

Statistics Canada / Health Canada data acknowledgment

Several datasets in the catalogue are derived from Statistics Canada and Health Canada PUMFs (CCS, CSADS, CSUS, CADS, CPADS). The standard disclaimer applies: although the analyses use Statistics Canada / Health Canada data, the analyses, interpretations, and conclusions are those of the analyst and do not represent the views of either agency.

Where to go next

- The `intro` vignette uses `morie_load_dataset()` end-to-end.
- The `cpads-canonicalization` vignette covers the CPADS column contract and `canonicalize_cpads_data()` helpers.
